DİNAMİK (6.hafta)

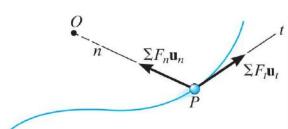

EĞRİSEL HAREKETTE KUVVET VE İVME (Normal ve Teğetsel Koordinatlar)

Bir parçacık eğrisel bir yörünge üzerinde hareket ediyorsa, hareket denklemleri normal ve teğetsel koordinatlarda yazılabilir. \vec{u}_t ve \vec{u}_n bu t ve n eksenler üzerindeki birim vektörler olursa, Bu yönlerdeki kuvvetler ile oluşan atalet kuvvetleri vektörel denklem olarak aşağıdaki şekilde yazılır.

$$\Sigma \vec{F} = m\vec{a}$$

Buradaki vektörler bileske vektörlerdir. Eksenler üzerindeki bileşenler cinsinden yazarsak.

$$\Sigma F_t \vec{u}_t + \Sigma F_n \vec{u}_n = m \vec{a}_t + m \vec{a}_n$$

Bu denklemdeki kuvvet ve ivmeleri eksenler üzerinde gösterdikten sonra vektörlerin şiddetini skaler formüller olarak ayrı ayrı yazabiliriz. Bu formüller daha önceki kinematik kısımda gördüğümüz formüllerin aynısıdır. t-eksenindeki formüllerimiz;

$$\Sigma F_t = ma_t$$

 a_t değişken ise;

$$a_t = \frac{dv}{dt}$$
, $v_t = \frac{ds}{dt}$, $a_t ds = v_t dt$

 a_t sabit ise;

$$v_t = v_{0t} + a_t t$$

$$v_t^2 = v_{0t}^2 + 2a_t (s - s_0)$$

$$s_t = s_{0t} + v_{0t}t + \frac{1}{2}a_t t^2$$

n-eksenindeki formüller ise;

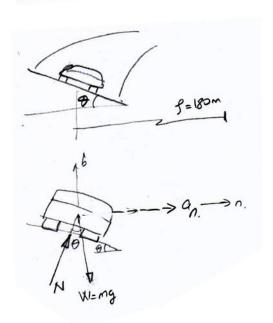

$$\Sigma F_n = ma_n$$

$$a_n = \frac{v^2}{\rho}, \qquad \rho = \left| \frac{[1 + (dy/dx)^2]^{3/2}}{d^2 v/dx^2} \right|$$

olur. p eğrinin bir herhangi bir noktasında ölçülen yarıçapı olup, cismin hareketi x-y eksenleri üzerindeki koordinatlara bağlı olarak verilirse, bu formül enrinin istenen herhangi bir noktasındaki yarıçapı bize verecektir.
