The mechanism for a car window winder is shown in the figure. Here the handle turns the small cog C, which rotates the spur gear S, thereby rotating the fixed-connected lever AB which raises track D in which the window rests. The window is free to slide on the track. If the handle is wound with angular velocity ω_c , determine the speed of points A and E and the speed v_w of the window at the instant θ .

$$\omega_C = 0.5 \frac{\text{rad}}{\text{s}}$$
 $r_C = 20 \text{ mm}$ $\theta = 30 \text{ deg}$ $r_S = 50 \text{ mm}$ $r_A = 200 \text{ mm}$

Solution:

$$v_C = \omega_C r_C$$

$$v_C = 0.01 \frac{\text{m}}{\text{s}}$$

$$\omega_S = \frac{v_C}{r_S} \qquad \omega_S = 0.20 \frac{\text{rad}}{\text{s}}$$

$$v_A = v_E = \omega_S r_A$$

$$v_A = \omega_S r_A \qquad v_A = v_E = 40.00 \frac{\text{mm}}{\text{s}}$$

Points A and E move along circular paths. The vertical component closes the window.

$$v_W = v_A \cos(\theta)$$
 $v_W = 34.6 \frac{\text{mm}}{\text{s}}$

 $v_A = \omega_S r_A$

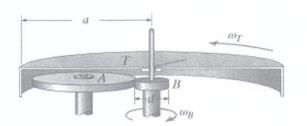

Örnek

The turntable T is driven by the frictional idler wheel A, which simultaneously bears against the inner rim of the turntable and the motor-shaft spindle B. Determine the required diameter d of the spindle if the motor turns it with angular velocity ω_R and it is required that the turntable rotate with angular velocity ω_T .

Given:

$$\omega_B = 25 \frac{\text{rad}}{\text{s}}$$

$$\omega_T = 2 \frac{\text{rad}}{\text{s}}$$
 $a = 9 \text{ in}$

D

Solution:

$$\omega_B \frac{d}{2} = \omega_A \left(\frac{a - \frac{d}{2}}{2} \right) \qquad \omega_A = \frac{\omega_B d}{a - \frac{d}{2}} \qquad \omega_A \left(\frac{a - \frac{d}{2}}{2} \right) = \omega_T a \qquad \frac{\omega_B d}{2} = \omega_T a \qquad d = \frac{2\omega_T a}{\omega_B}$$

$$d = 1.44 \text{ in}$$
